

UNIT 5 PERIODIC TABLE and BONDING

1. The periodic table
2. Why do atoms bond
3. Types of substances
4. Atomic mass
5. Molecular mass
6. The mole

1. THE PERIODIC TABLE

In the periodic table the elements are arranged by increasing their atomic number so H is the first element because it has an atomic number of one, then on its right we have He which has an atomic number of two..

| Group | | The transition elements | | | | | | | | | | Group | | | | | |
|-----------------------------|-----------------------------|------------------------------|---------------------------------|------------------------------|-------------------------------|------------------------------|------------------------------|-------------------------------|------------------------------|--------------------------------|--------------------------------|-----------------------------|----------------------------------|------------------------------|--------------------------------|------------------------------|---------------------------|
| I | II | | | | | | | | | | | III | IV | V | VI | VII | VIII |
| 1 | 2 | | | | | | | | | | | 3 | 4 | 5 | 6 | 7 | 8 |
| 7 Li 3 lithium | 9 Be 4 beryllium | | | | | | | | | | | 11 B 5 boron | 12 C 6 carbon | 14 N 7 nitrogen | 16 O 8 oxygen | 19 F 9 fluorine | 20 Ne 10 neon |
| 23 Na 11 sodium | 24 Mg 12 magnesium | | | | | | | | | | | 27 Al 13 aluminium | 28 Si 14 silicon | 31 P 15 phosphorus | 32 S 16 sulfur | 35.5 Cl 17 chlorine | 40 Ar 18 argon |
| 39 K 19 potassium | 40 Ca 20 calcium | 45 Sc 21 scandium | 48 Ti 22 titanium | 51 V 23 vanadium | 52 Cr 24 chromium | 55 Mn 25 manganese | 56 Fe 26 iron | 59 Co 27 cobalt | 58 Ni 28 nickel | 64 Cu 29 copper | 65 Zn 30 zinc | 70 Ga 31 gallium | 73 Ge 32 germanium | 75 As 33 arsenic | 79 Se 34 selenium | 80 Br 35 bromine | 84 Kr 36 krypton |
| 85 Rb 37 rubidium | 88 Sr 38 strontium | 89 Y 39 yttrium | 91 Zr 40 zirconium | 93 Nb 41 niobium | 96 Mo 42 molybdenum | 99 Tc 43 technetium | 101 Ru 44 ruthenium | 103 Rh 45 rhodium | 106 Pd 46 palladium | 108 Ag 47 silver | 112 Cd 48 cadmium | 115 In 49 indium | 119 Sn 50 tin | 122 Sb 51 antimony | 128 Te 52 tellurium | 127 I 53 iodine | 131 Xe 54 xenon |
| 133 Cs 55 caesium | 137 Ba 56 barium | 139 La 57 lanthanum | 178 Hf 72 hafnium | 181 Ta 73 tantalum | 184 W 74 tungsten | 186 Re 75 rhenium | 190 Os 76 osmium | 192 Ir 77 iridium | 195 Pt 78 platinum | 197 Au 79 gold | 201 Hg 80 mercury | 204 Tl 81 thallium | 207 Pb 82 lead | 209 Bi 83 bismuth | 210 Po 84 polonium | 210 At 85 astatine | 222 Rn 86 radon |
| 223 Fr 87 francium | 226 Ra 88 radium | 227 Ac 89 actinium | | | | | | | | | | | | | | | |
| | | Lanthanides | | | | | | | | | | | | | | | |
| | | Actinides | | | | | | | | | | | | | | | |
| | | 140 Ce 58 cerium | 141 Pr 59 praseodymium | 144 Nd 60 neodymium | 147 Pm 61 promethium | 150 Sm 62 samarium | 152 Eu 63 europium | 157 Gd 64 gadolinium | 159 Tb 65 terbium | 162 Dy 66 dysprosium | 165 Ho 67 holmium | 167 Er 68 erbium | 169 Tm 69 thulium | 173 Yb 70 ytterbium | 175 Lu 71 lutetium | | |
| | | 232 Th 90 thorium | 231 Pa 91 protactinium | 238 U 92 uranium | 237 Np 93 neptunium | 244 Pu 94 plutonium | 243 Am 95 americium | 247 Cm 96 curium | 247 Bk 97 berkelium | 251 Cf 98 californium | 252 Es 99 einsteinium | 257 Fm 100 fermium | 258 Md 101 mendeleevium | 259 No 102 nobelium | 262 Lw 103 lawrencium | | |

As the atomic number increases the number of electrons also increases. The important thing about the electrons is how they are placed around the nucleus. They are arranged in different energy levels and that is what determines their chemical behaviour.

The horizontal rows in the periodic table are called periods.

The vertical columns are called groups.

All the elements in the same group have similar properties and all the elements in the same period have electrons placed in similar energy levels.

We classify all the elements in two groups: metals and non-metals.

Metals are the elements on the left side of the red line.

In the picture you can see where they are placed.

The name of the groups are:

Alkali (alcalinos)

(Acalino térreos)
(Térreos)
(Carbonoideos)
(Nitrogenoideos)
(Anfígenos)

Halogens (Halógenos)

Noble gases (Gases nobles)

The noble gases are very stable, because they have eight electrons in the outer shell and this gives them a great stability.

2.WHY DO ATOMS BOND

Atoms tend to join together to become more stable. For that reason, the majority of atoms, except those of the noble gases, are joined to other atoms forming chemical bonds.

Elements bond together to make substances (Both simple substances and compounds).

Atoms bond with each other in order to gain a stable arrangement of outer-shell electrons, like the noble gases group does.

This means that they bond to have 8 electrons in their outer shell. This is called the octet rule.

The three main types of bonding are:

Ionic bonding

Covalent bonding

Metallic bonding

Substances can form different structures:

- Molecules, are aggregates formed of a small, fixed number of atoms.
- Crystals, are aggregates formed of a large, variable number of atoms, ions or cations which are ordered in space.

3.TYPES OF SUBSTANCES

MOLECULES

Atoms that form this type of structure: Non metal with non metal, they can be the same atoms (Cl_2) or different atoms (H_2O)

How do atoms bond: They bond by the electrons shared among the atoms.

They share one or more pair of electrons

Structure:

As two or more specific atoms join, they form molecules

Properties of molecules:

- Low melting and boiling points, most of them are gases, many are liquids and a few are solids.
- They don't conduct heat nor electricity.
- The ones which are solids are soft.

Examples: Cl_2 , CO_2 , H_2O

Language:

Most

Many

A few

COVALENT CRYSTALS

Atoms that form this type of structure: Non metal with non metal they can be the same atoms (Diamond C) or different atoms (SiO₂)

How do atoms bond: They bond by the electrons shared among the atoms.

They share one or more pair of electrons

Structure: Covalent lattice, with different arrangements, depending on the substance.

A covalent lattice is a regular repeating arrangement of ATOMS in the solid

Properties of covalent crystals:

- All of them are in the solid state.

Examples: SiO₂, C-graphite, C-diamond

IONIC CRYSTALS

Atoms that form this type of bond : Metal and non metal

How do atoms bond : This bond is made by the electron transfer between the metal and the non metal atoms.

The metal loses electrons, and becomes a cation.

The non-metal gains the electrons that the metal loses and becomes an anion.

Ions stick together strongly because of electrostatic forces and they make an ionic substance.

Structure: Ionic lattice, with different arrangements, depending on the substance.
An ionic lattice is a regular repeating arrangement of IONS in the solid.

Properties of ionic compounds:

- They conduct electricity when they are melted or dissolved, because conducting allows the charges to move. When they are in the solid state the ions are locked in place. Ionic solids are insulators.

- They have high melting points because of the strong forces between ions.
- Ionic solids are brittle because, when we make a force in them strong repulsion breaks crystal apart.

Examples: NaI, BaS, KCl, BaCl₂...

METALLIC CRYSTALS

Atoms that form this type of bond: Metals with themselves.

How do atoms bond: This bond is formed by the collective electron sharing among all the atoms.

Structure: Metallic lattice. A metallic lattice is a regular repeating arrangement of CATIONS in a "sea" of electrons shared between all the cations and they are free to move.

Properties of metallic crystals:

High melting points

Malleable and ductile: It means that they can be pressed and moulded into sheets and into wires respectively, because the electrons allow atoms to slide by.

Good conductors of heat and electricity, because they have free electrons in the lattice.

Typically they are shiny. (They shine)

When they mix with other metals they don't bond they became a mixture called an alloy (aleación).

Examples: Mg, Cu, Fe...

4.ATOMIC MASS

It has the same value as the relative atomic mass but stated in uma.

Atomic mass is the average of all the isotopes of an element. The unit to express this magnitude is uma.

It is approximately equal to the mass of a single proton or neutron.

Chemists have defined the carbon-12 atom as having a mass of 12 atomic mass units.

So 1 uma = 1/12 the mass of a Carbon-12 atom.

5.MOLECULAR MASS

It is the mass of a molecule.

It is calculated by adding the atomic masses of all the atoms that build the molecule stated in uma.

6.AVOGADRO'S NUMBER, the mole

A mole of any substance contains $6,022.10^{23}$ particles. This number is called Avogadro's number.

These particles can be molecules or atoms (or ions), it depends on what substance we are dealing with. If it is an element the particles are atoms, whereas if it is a compound the particles are molecules.

In both cases we represent the number of particles with the letter N.

Avogadro's number is represented with the letter N_A

$$N = n \cdot N_A$$

7.MOLAR MASS

It is the mass of one mole of an element or compound. It is represented by **M**

The molar mass of a compound is the sum of the molar masses of the atoms in the formula.

Example: Calculate the molar mass of CaCl_2 .

| Atom | Number of Moles | Atomic Mass | Total Mass |
|-----------------------------------|-----------------|-------------|----------------|
| Ca | 1 | 40.1 g/mole | 40.1 g |
| Cl | 2 | 35.5 g/mole | 71.0 g |
| CaCl_2 | | | 111.1 g |

Amount of substance

You can convert mass into moles, or moles into mass using the formula:

The magnitude **amount of substance** is represented with the letter **n** and its unit is **mole**.

A molar mass factor and Avogadro's number convert

- mass to particles.

GLOSSARY

| | |
|----------------|----------------------|
| bonding | /ˈbɒndɪŋ/ |

UNIT 5 ACTIVITIES

A1- ABC dictation. (act 1.13 Teaching others subjects through English, Deller & Price, Oxford)

Take an A-4 sheet of paper and cut it into four rectangular pieces .

Write on the top one letter A, B , C or D. The teacher will tell you which one.

Put a number on the left from one to four.

The teacher will read a text and you have to write it when she says your letter.

.....

Sit with three students (groups of four) that have different letters but the same number and exchange your information .

What do you find in common? What is the name of the topic?

Let´s listen to the whole texts and check your writings.

A2-Using the periodic table data, write :

- The relative atomic mass of a He atom
- The atomic mass of a Be atom
- The relative molecular mass of a molecule of CO₂
- The molecular mass of a molecule of water
- The atomic mass of a C atom

f) The relative molecular mass of a NH_3 molecule.

A3- Questions to answers (5.10 Teaching other subjects through English, Deller&Price, Oxford).

There you have several answers. You have to write the question for each answer.

It is 12 u

It is 14

It is 16 g

Arranged in molecules.

Doesn't conduct electricity when solid but it does when liquid.

They are formed by metal and non-metal atoms.

They conduct electricity because in their lattice there are free electrons

A4- How many moles are made of $5,4 \cdot 10^{20}$ molecules?

How many molecules are there in 3 mole?

A5- What is the proper unit to calculate the mass of one mole?

Calculate the mass of 2 mole of H₂

What is the proper unit to calculate the mass of one molecule?

Calculate the mass of 3 molecules of Cl₂

What do we have to do to calculate the mass of a number of molecules in grams?

Calculate the mass in grams of $4,7 \cdot 10^{21}$ molecules of water

A6- If we have 45 g of O₂. How many moles of oxygen do we have?

If we have 45 g of oxygen. How many molecules of oxygen do we have?

A7-If the odor of C₆H₁₀S can be detected from 2×10^{-13} g in one litre of air, how many molecules of C₆H₁₀S are there?

A.8-How many H₂O molecules are in 24.0 g H₂O?

A.9-Look up in the periodic table the relative atomic masses that you need, and repeat out loud (DON´ T WRITE) the following sentences with the substances:

Li BeCl₂

C K(OH)

Mg Cl₂

Al HF

| | | | | | |
|--------|----|--|---------------|--|-----|
| 1 atom | of | | has a mass of | | uma |
|--------|----|--|---------------|--|-----|

| | | | | | |
|------------|----|--|---------------|--|-----|
| 1 molecule | of | | has a mass of | | uma |
|------------|----|--|---------------|--|-----|

| | | | | | |
|--------------------------|----------|--|----------------|--|---|
| 6,022 x 10 ²³ | atoms of | | have a mass of | | g |
|--------------------------|----------|--|----------------|--|---|

| | | | | | |
|--------|----|--|---------------|--|---|
| 1 mole | of | | has a mass of | | g |
|--------|----|--|---------------|--|---|

A10- Answer the following five questions:

Calculate the number of moles are made of 8×10^{23} particles.

Calculate the number of particles that are in 2 moles.

Calculate the number of moles that are made of 64 g of O₂ (A_rO = 16)

Calculate the mass of four moles of H₂ (A_rH=1)

Calculate the number of moles that are made of 12 g of H₂ (A_rH=1)

UNIT 5 EXERCISES

| 1 | <p>Copy and complete the paragraph using these words: electrostatic energy forces high ionic negative</p> <p>In giant _____ structures the _____ attractive _____ between the positive and _____ ions are very strong. Ionic compounds have very _____ melting points and boiling points because it takes a lot of _____ to overcome these forces.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|---|-----------------------|------------------------|-----------------------|------------------------|---------------------|---|-----|------------------|------------------|-----------|---|-----|------------------|----------|---------|---|-----|------------------|------------------|-----------|---|------|----------|----------|-----------|---|-----|------------------|----------|---------|
| 2 | <p>Copy and complete using the words below: attraction delocalised energy high melting mobile positive</p> <p>In metallic bonding the _____ metal ions are held together by a sea of _____ electrons. The strong electrostatic _____ between the ions and the _____ electrons gives many metals their strength. Because it takes a lot of _____ to overcome these strong electrostatic forces the _____ and boiling points of most metals is _____.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 3 | <p>State whether the following pairs of elements form ionic or covalent compounds when they combine:</p> <ul style="list-style-type: none"> (a) sodium and chlorine (b) hydrogen and oxygen (c) hydrogen and chlorine (d) lithium and chlorine (e) sodium and iodine | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 4 | <p>The table shows some properties of different substances.</p> <table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <thead> <tr> <th style="padding: 5px;">substance</th> <th style="padding: 5px;">melting point/°C</th> <th style="padding: 5px;">conductivity of solid</th> <th style="padding: 5px;">conductivity of liquid</th> <th style="padding: 5px;">solubility in water</th> </tr> </thead> <tbody> <tr> <td style="padding: 5px;">A</td> <td style="padding: 5px;">-56</td> <td style="padding: 5px;">does not conduct</td> <td style="padding: 5px;">does not conduct</td> <td style="padding: 5px;">insoluble</td> </tr> <tr> <td style="padding: 5px;">B</td> <td style="padding: 5px;">610</td> <td style="padding: 5px;">does not conduct</td> <td style="padding: 5px;">conducts</td> <td style="padding: 5px;">soluble</td> </tr> <tr> <td style="padding: 5px;">C</td> <td style="padding: 5px;">-70</td> <td style="padding: 5px;">does not conduct</td> <td style="padding: 5px;">does not conduct</td> <td style="padding: 5px;">insoluble</td> </tr> <tr> <td style="padding: 5px;">D</td> <td style="padding: 5px;">2310</td> <td style="padding: 5px;">conducts</td> <td style="padding: 5px;">conducts</td> <td style="padding: 5px;">insoluble</td> </tr> <tr> <td style="padding: 5px;">E</td> <td style="padding: 5px;">680</td> <td style="padding: 5px;">does not conduct</td> <td style="padding: 5px;">conducts</td> <td style="padding: 5px;">soluble</td> </tr> </tbody> </table> <p>Classify each of these substances as metals, giant ionic structures or simple molecular structures.</p> | substance | melting point/°C | conductivity of solid | conductivity of liquid | solubility in water | A | -56 | does not conduct | does not conduct | insoluble | B | 610 | does not conduct | conducts | soluble | C | -70 | does not conduct | does not conduct | insoluble | D | 2310 | conducts | conducts | insoluble | E | 680 | does not conduct | conducts | soluble |
| substance | melting point/°C | conductivity of solid | conductivity of liquid | solubility in water | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| A | -56 | does not conduct | does not conduct | insoluble | | | | | | | | | | | | | | | | | | | | | | | | | | | |
